

Project – Data Cleaning and Analysis with Power Query

In this project, I used various features of **Power Query** to clean and preprocess a dataset for analysis. The objective was to ensure data consistency, remove unnecessary formatting issues, and create new calculated columns to support downstream insights. Below are the step-by-step actions I performed:

1. I selected the raw data range and used **Data > From Table/Range** to load the dataset into Power Query. I confirmed the table creation with headers by clicking **OK**.
2. To remove redundancy, I used **Remove Rows > Remove Duplicates** to eliminate any duplicate records in the dataset.

fx = Table.Distinct(#"Changed Type", {"Order ID"})

	Order ID	Order Date	Arrival Date	Name	Department
1	25691	3/8/2024 12:00:00 AM	3/16/2024 12:00:00 AM	Bill Smith	Cloud Tech

3. To compute the **number of days between the order date and arrival date**, I selected both columns (first Arrival Date, then Order Date) and navigated to **Add Column > Date > Subtract Days**. This generated a new column with the calculated duration in days.

fx = Table.AddColumn(#"Renamed Columns", "Duration", each [Arrival Date]-[Order Date])

	Department, Region	Payment Type	Revenue	Profit	Duration
1	Cloud Tech, Texas	Card	42845	8846	8.00:00:00

fx = Table.TransformColumns(#"Added Custom",{"Duration", Duration.Days, Int64.Type})

	Department, Region	Payment Type	Revenue	Profit	Duration
1	Cloud Tech, Texas	Card	42845	8846	8
2	Strategy, New York	Card	34152	13489	84

4. The **Name** column was cleaned by applying two formatting steps:
 - a) **Transform > Format > Capitalize Each Word** ensured consistent capitalization of names.

fx = Table.TransformColumns(#"Replaced Value1",{"Name", Text.Proper, type text})

	Name	Department	Region	Payment Type	Revenue
1	Bill Smith	Cloud Tech	Texas	Card	42845
2	Ken Singh	Strategy	New York	Card	34152
3	Harley Fritz	Strategy	New York	Card	13489

- b) **Transform > Format > Trim** was used to remove any leading or trailing spaces.

fx = Table.TransformColumns(#"Capitalized Each Word",{"Name", Text.Trim, type text})

	Name	Department	Region	Payment Type	Revenue
1	Bill Smith	Cloud Tech	Texas	Card	42845
2	Ken Singh	Strategy	New York	Card	34152

5. To fix extra spacing between first and last names, I selected the Name column, chose **Replace Values**, and replaced **double spaces** with a **single space**. This corrected the formatting issue and improved readability.

fx = Table.ReplaceValue(#"Trimmed Text", " ", " ", Replacer.ReplaceText, {"Name"})

	Name	Department	Region	Payment Type	Revenue
1	Bill Smith	Cloud Tech	Texas	Card	42845
2	Ken Singh	Strategy	New York	Card	34152

6. For better segmentation, I merged the **Department** and **Region** columns into a single column using **Transform > Merge Columns**, with a comma followed by a space as the separator.

A	B	C	D	E	F	G	H	I	J
Order ID	Order Date	Arrival Date	Days to A	Name	Department, Region	Payment Type	Revenue	Profit	Profit Margin
